

Task: Instant Consultation Type Selection UI

Project: **EVM**

- Replaced the single-click “BOOK APPOINTMENT” action with an explicit instant-consultation selection interface
- Introduced a contextual button group that expands on user interaction and hides the original booking trigger
- Implemented clear, user-driven options for Doctor, Physician Assistant, and Nursing Practitioner selection
- Updated searchprovider.html to align visual behavior with explicit consultation intent
- Validated UI interaction flow to prevent accidental bookings and improve decision clarity

Task: Booking Confirmation Dialog Integration for Instant Consultation

Project: **EVM**

- Enhanced booking logic to accept a dynamic itemType representing the selected consultation provider
- Wired each instant-consultation option to invoke `showBookingConfirmationDialogForInstantConsultation(itemType)`
- Implemented defensive defaults for itemType to preserve backward compatibility with existing flows
- Passed consultation type explicitly into `$mdDialog.show()` via locals for deterministic dialog state handling
- Updated searchprovider.js to ensure clean data flow between UI selection and booking confirmation
- Performed end-to-end validation to confirm correct provider routing and zero regression in booking behavior
